Session 1
Introduction to SaaS And CRM

1. what is SaaS?

Definition:
SaaS → Software as a service is a cloud based software delivery model where users can access application over the internet instead of installing them on their local computer. The software is hosted and maintained by the provider

Benefits.
Scalable for business of any size
Automatic updates and maintance
Accessible from anywhere on internet
No installation of heavy hardware required

Examples of SaaS.

Salesforce: Cloud based CRM platform for managing sales, marketing & customers service. for
Zoho CRM: A customer relationship management system for sales tracking and automation
Microsoft Dynamics 365: A cloud based suite combining CRM & ERP solution.

Date

Introduction

Communication tool

- main value is software functionality
- you access it over the internet
- you don't manage infrastructure
- It's usually subscription based
- Same software, many users.

How business use CRM to manage customer relationship and sales
Business use customer relationship management (CRM) system as an centralized brain to manage the entire customer life cycle

CRM manage customer relationship through the following ways:

1. Central data: stores contact details, purchase history, communication preferences, and past support issues in one accessible location.

2. Proactive Service: support teams use CRM history to resolve issues faster without asking customers to repeat themselves.

3. Personalized engagment :- compains segment customer based on behaviour, demo - graphics to deliver tailored offers and messages, which can increase customer satisfaction and loyalty.

4. Retention strategy : Automed triggers send "welcome" flows, anniversary rewards or "win-back" emails to re-engage dormant customers.

It drives sales through
1. Lead management
2. Pipeline visibility
3. Sales automation
4. Accurate forecasting

Overview of CRM features

1. contacts (database)

- Single Source of truth - centralizes all names, emails, phone numbers etc... in one searchable location.
- Interaction history - automatically logs every thing
- Segmentation - groups contacts by certain criteria like industry, location.

2. Deals (opportunities) - represent a potential sale with a specific value attached to a contact or company
- value tracking, win probability and collaboration

3. Pipelines : stages, pipeline health, forecasting

4. Automation (the efficiency engine):
- Task triggers
- email sequences
- Data entry.
